

Task Cards Dashboard [1]

Task cards are rectangular cards which contain regular task fields as form elements (date of creation, task number, subject, description, completion date or time and status).

There should be a **one page dashboard** containing columns of **status items** (say Pending, Work In Progress, Completed etc.). There should be a create card button which creates a task card in each status item.

Status Items - we can have a few default status and more status items can be added.

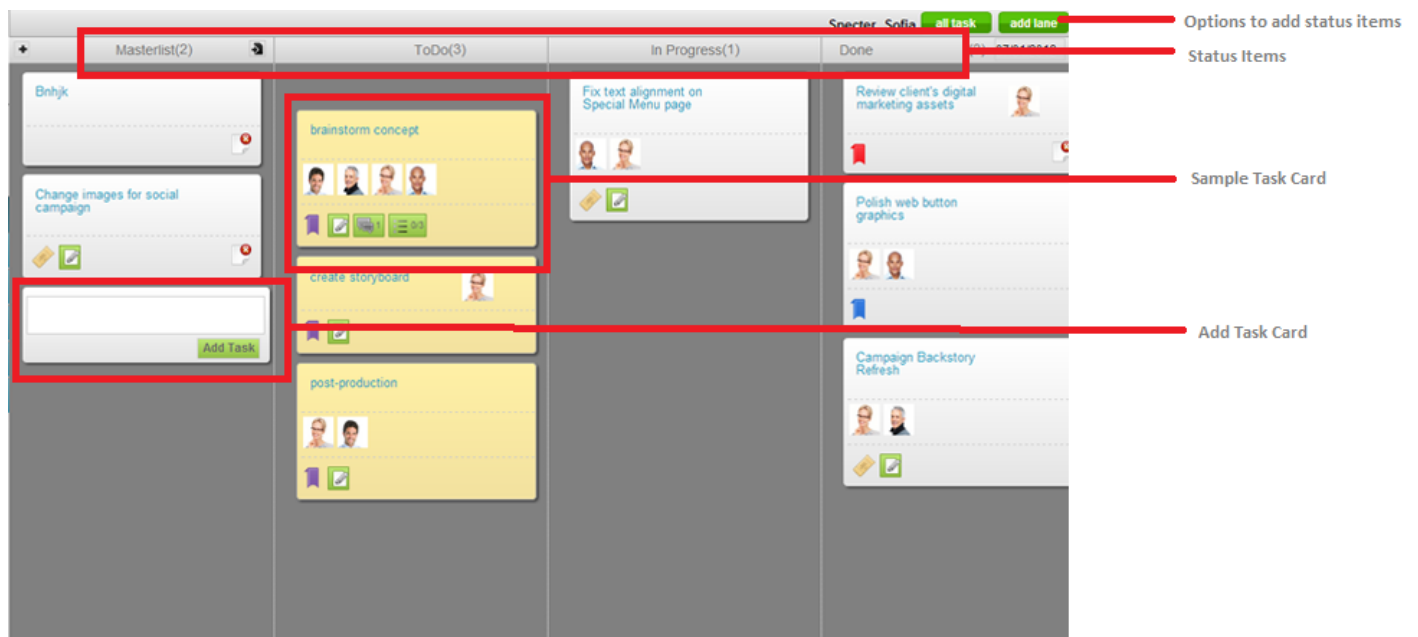

We should be able to **create new status items**, **Add** task cards to any status item, **delete** task cards in any status, delete all the cards in one status item and delete the status item itself.

To update the task card status we should be able to **drag and drop cards** from one status column to another.

We can also have an android-like bin to which cards can be **delete via drag-drop** or maybe a **deleted status item**.

Object oriented and native javascript would be preferred.

Example mockup / wireframe below (feel free to change it) :
